

Compost Tea

Adds Life to Your Soil!

Compost Tea is made by aerifying compost in water and can be used in any lawn care program, for landscape ornamentals and trees as well as vegetable and perennial gardens.

The tea is used as either a foliar application or applied directly to the soil. Because it contains aerobic organisms there are many benefits to our soils, such as the suppression of harmful insects and diseases. It can also degrade toxic pesticides and other chemicals present in the environment.

Compost Tea provides soluble micronutrients that either feed soil organisms or react with nutrients locked in the soil, making them available for plant uptake. This helps to create a healthier and self-sustaining landscape.
